Software Engineer

Software Engineering Team · Flock Energy

Openings	4–5 positions
Experience	0–2 years
Employment type	Full-time
Location	Noida, India (hybrid)
Compensation	₹6–12 LPA, based on fit and skill set

ABOUT FLOCK ENERGY

Flock Energy is a product-based engineering company building AI/ML solutions for electrical utilities. Incorporated in London in 2023 and operating in India ever since, we design innovative products – from in-house IoT hardware to large-scale data platforms – that solve real problems faced by an ever-evolving grid. We work with leading DISCOMs such as JVVNL, Tata Power and BSES, and partner with sector bodies including the Ministry of Power, REC and RRECL.

THE ROLE

We are growing our software engineering team and are looking for early-career engineers who want to build products that run on a real power grid. You'll work across our stack and ship work that is used by utilities across India.

WHAT YOU'LL WORK ON

- Design and build **APIs and data pipelines** that move high volumes of grid and device data for our data science operations.
- Develop backend services in **Python, Node.js and Rust**, deployed on **Microsoft Azure**.
- Model, query and optimise data in **PostgreSQL**.
- Contribute to our **Svelte** web apps, our **TypeScript** app, and integrations such as our **WhatsApp bot**.
- Write firmware and device-side software in **Rust and C** for our in-house **ESP32-based** hardware.
- Own problems end to end – from understanding the utility's challenge to shipping, monitoring and improving the solution.

You will be placed and trained according to your strengths, and assigned projects that suit them. No one is expected to know the whole stack on day one.

WHAT WE'RE LOOKING FOR

- Strong fundamentals in **data structures, algorithms and problem solving**.
- Proficiency in **at least one programming language** – e.g. C, Python, Rust, JavaScript/TypeScript.
- Working knowledge of **SQL** and relational databases.
- Core CS concepts: operating systems, networking, DBMS and object-oriented design.
- Understanding of how the web works – HTTP, REST APIs, JSON.

- Comfort with **Git**, the Linux command line, debugging and writing clean, testable code.

GOOD TO HAVE

- Cloud engineering (Azure preferred), Docker, CI/CD.
- Electrical engineering or power-systems knowledge.
- Embedded / IoT experience – microcontrollers (ESP32), MQTT or similar protocols.
- Frontend or UI/UX design skills.
- Exposure to data engineering or machine learning.
- Personal projects, open-source contributions or hackathons you can walk us through.

HOW WE WORK

- **Curious problem-solvers.** You look around a problem, not just at it, and you're willing to step outside your comfort zone to find the answer.
- **AI-first, understanding-always.** We actively encourage AI tools in your daily work – but you must understand, and be able to explain, everything you ship.
- **Ownership.** You care about whether the solution works for the utility at the other end, not just whether the code compiles.
